

Technical Considerations

Unleaded gasoline has the tendency to degrade progressively thus generating sedimentations which might obstruct the injection nozzles. This degrading affects also a proper combustion process causing, in addition to loss of power, an higher consumption and a rise of exhaust emissions as well. Additionally the life of the catalytic muffler will be shortened. Besides, due to its weak lubricating capacity, the valves and valve seats are subject to an early wear. A little increase of the octane index will be positive too.

Savekat combines the following actions: keeps clean, protects the sliding parts, improves the combustion process, rises the power up, keeps fuel consumption and emissions down.
